

# Move Airdropper based on Github

-- coin & nft airdrop tool  
implimentation on Aptos Network

NonceGeekDAO

2023 / 02

# Short Introduction

Airdropper is both a Aptos-based airdrop tool and an extension of MoveDID.

On the one hand, it can be used to airdrop directly to a list of Aptos addresses, on the other hand, after binding Aptos addresses with GitHub accounts through MoveDID, it can be used to bulk airdrop to contributors of designated Repo or Organization.

**Background —**

**DAO Plugin System Based on Github and Aptos**

## DAO Plugin System Based on Github and Aptos

There are many builders that try to build a DAO system that includes airdrops, polls, etc., but probably it will be a standalone system.

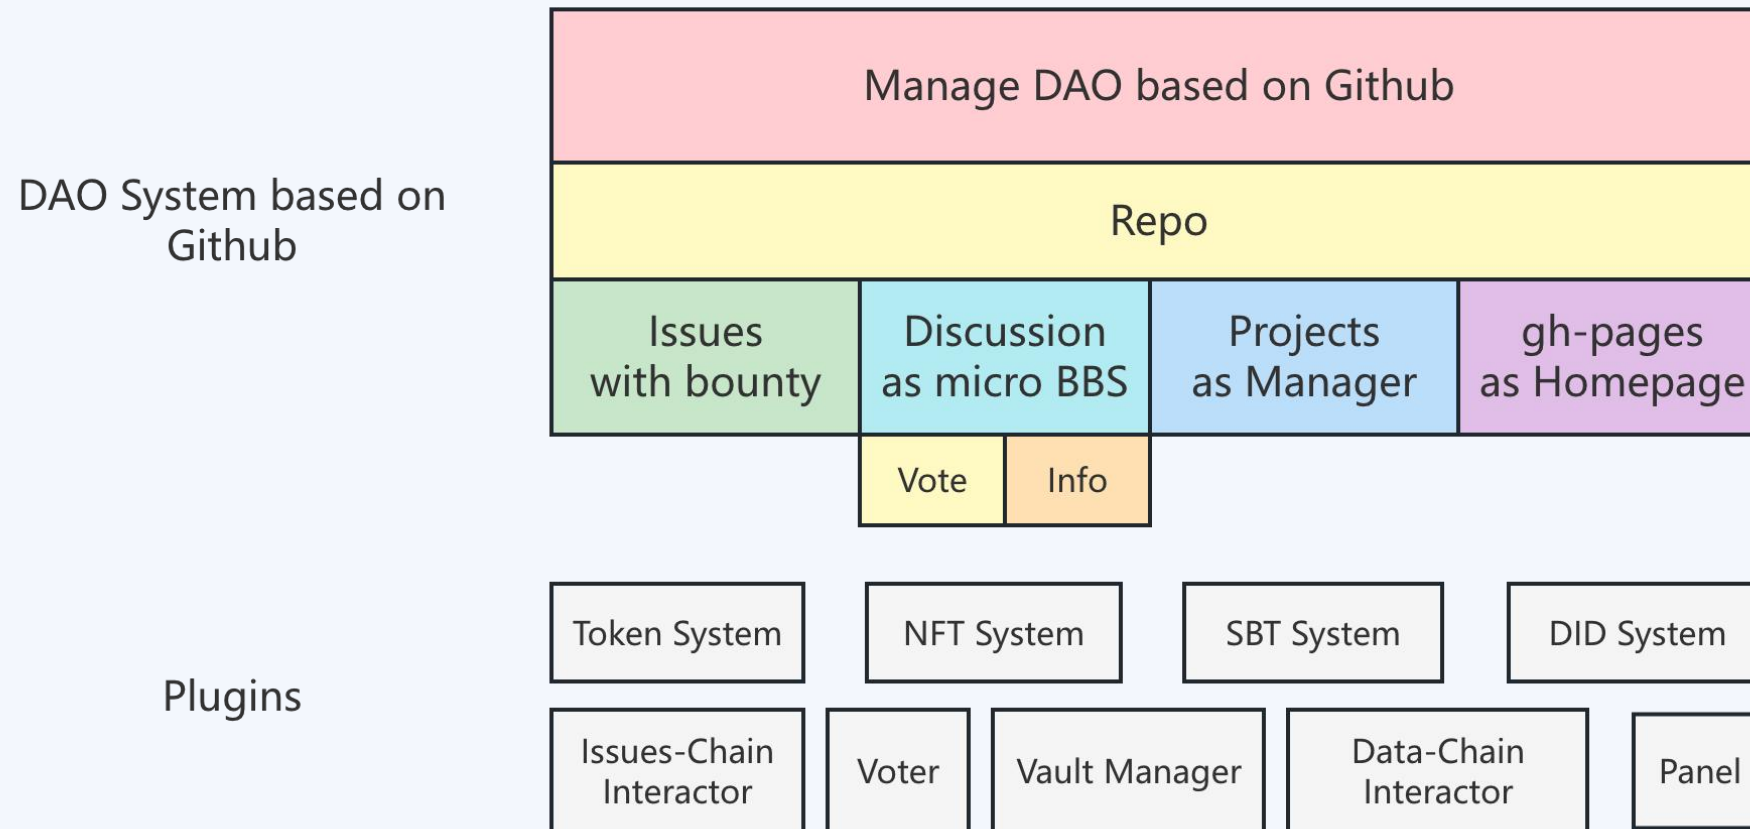

However, with the development of the open source culture, Git + Github already has the capability for large-scale multi-party asynchronous collaboration.

Therefore, designing a DAO plugin system based on Github and Move chains like Aptos is a **lighter, more sensible, and less mentally taxing solution** for developers.

## DAO Plugin System Based on Github and Aptos

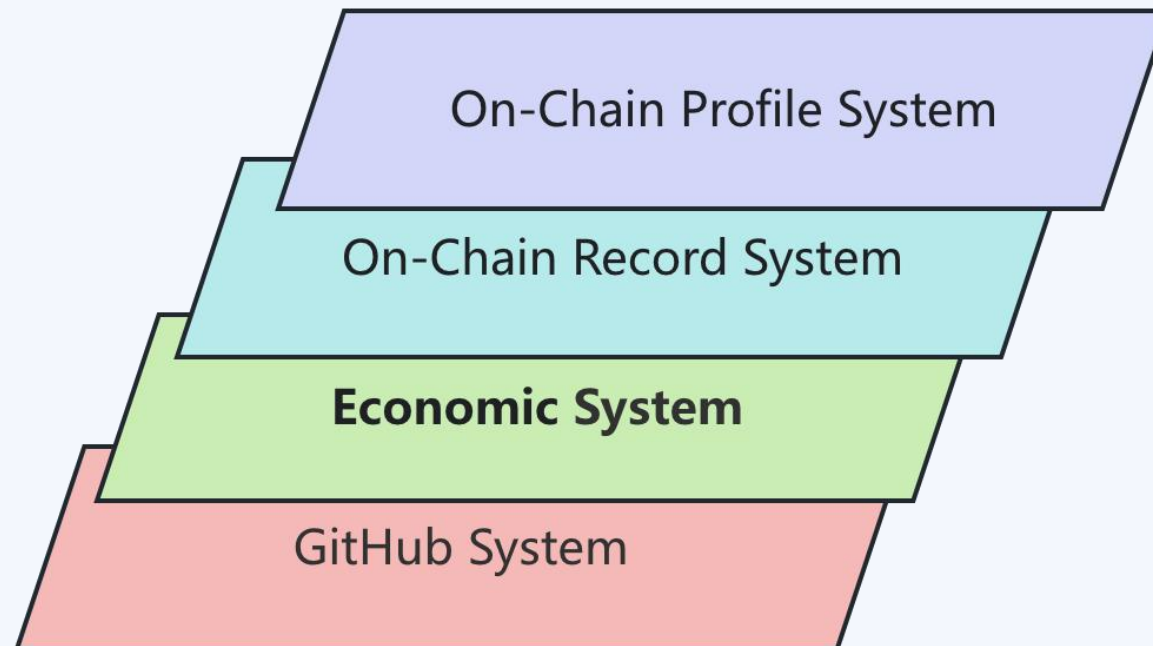

Coin/NFT Airdropper is a part of Token Module and NFT Module.

## Generate economic actions targeted at Repo / Organization

Through plugins such as Coin/NFT Airdropper, Github is empowered with an economic layer so that various economic actions such as airdropping and crowdfunding can occur targeting Repo / Organization.

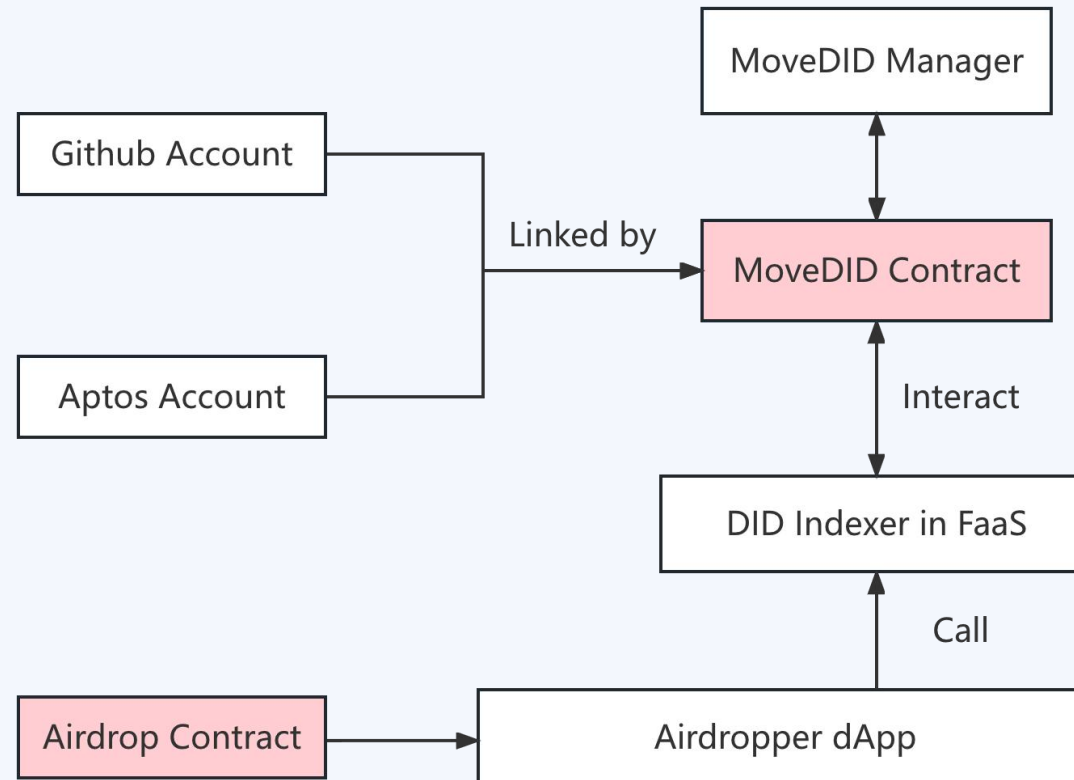

## Project Framework

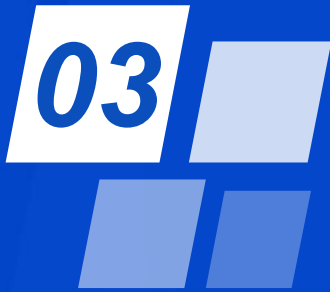

## MoveDID: Connect Aptos Account & Github Account

Airdropper: Airdrop Coin/NFT by Github Acct List or Aptos Acct List

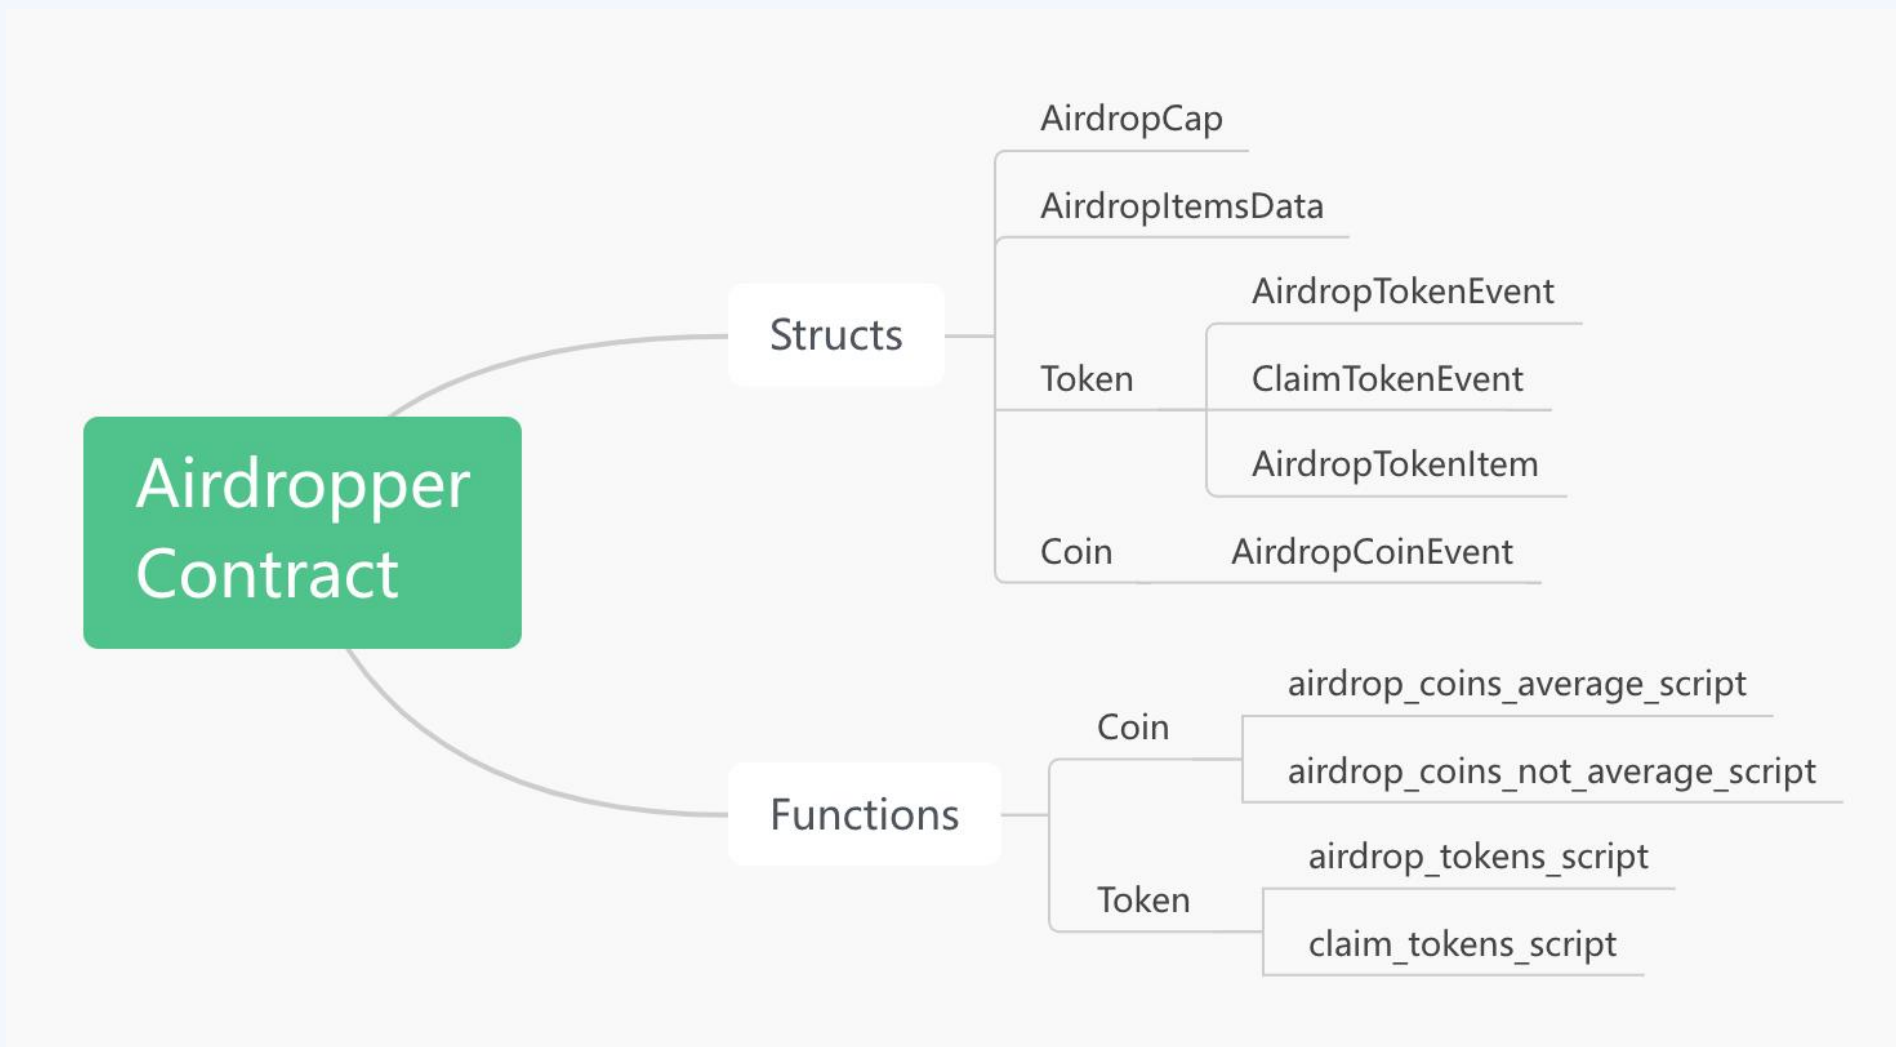

## Brief introduction to the contract

## Brief introduction to the contract

## dApp Features Demo

# Features

Airdrop same amount of coins to addresses list

Module Path:0x4139eaf9a8f1ee32431e6d33876a8a4243be4b0d7fbf76f0cb0315ec92452369::airdropper
